

Using Margin Protection Insurance to Manage High Input Costs in 2023: Considerations for Kansas Producers

Jennifer Ifft, Flinchbaugh Agricultural Policy Chair and Associate Professor

2022 KSU Risk and Profit Conference

Alumni Center: August 16-17, 2022

Online: August 25, 2022

Current economic conditions

MARKET WILD CARDS KEEP PRICES VOLATILE

By Cassidy Walter
8/4/2022

Farmers Feel the Squeeze of Inflation

Higher costs for seeds, fertilizer, weedkillers and labor could push up grocery bills this year, researchers say

Farm programs

.....At the hearing, Thompson, who is in line to chair the committee if Republicans win a House majority in the Nov. 8 elections, asked how a **margin protection plan for row crops**, already in use by dairy farmers, would compare to the current crop subsidy programs, which are triggered by low market prices. The dairy margin program issues payments when feed costs are too close to milk prices.

Margin Protection Insurance

Not
personalized
but basic

More
personalized
but more
complicated

Many questions

- What is it?
- Expected 2023 expected margins
- Sensitivity of margin to yield, price and input changes
- General revenue and expense trends

Detailed breakdown of Margin Protection

<https://agmanager.info/events/risk-and-profit-conference/previous-conference-proceedings/2017-risk-and-profit-conference/14>

<https://www.marginprotection.com/>

What is margin protection insurance?

When the operating margin (difference between revenue and *select* costs) *at the county level* for corn or soybeans is lower than expected, you get paid

OR

Similar to ECO (Enhanced Coverage Option) with earlier price discovery AND *some* adjustment for input costs

Where is it available?

**MP Soybeans Offer Map
2022**

**MP Corn Offer Map
2022**

Current use

Acres enrolled

KS 2022

~10,500 acres corn

~2,000 acres soybeans

KS 2018

~13,000 acres corn

~2,500 acres soybeans

Patterns

- Typically used with RP
- Higher coverage levels prevalent (90-95%)
- Indemnities paid in 2018-20 for many policies at 90-95% coverage level

Comparison: triggers

- YP: Triggered by farm yield decline
- RP: Triggered by farm yield and/or national price decline
- MP: Triggered by county yield and/or national price declines and/or national input cost increases

Comparison: triggers based on....

- YP: Farm yield x Feb. '23 futures
- RP: Farm yield x [Higher of (Feb '23 or Oct '23 futures)] (HPO)
- MP*: [County yield x Higher of (Aug/Sept '22 or Oct '23 futures)] – [County yield X national input prices]
 - National input prices – planting/April futures

Margin calculation

Expected Margin = Expected revenue- expected costs

Expected Revenue: County Expected Yield X projected price

Example: corn = 150 bu/acre X \$6.00 / bu = \$900

Expected Costs = Inputs subject to price changes + Inputs not subject to price changes

(Note: more accurate to say inputs who costs can be observed/measured vs those that cannot for insurance purposes)

“Subject to price change” input costs

2022 Crop Year

Corn Input Amounts (per Acre)	Urea (lbs./acre)	DAP (lbs./acre)	Potash (lbs./acre)	Diesel (gal/acre)	Costs not subject to price change
Corn Irrigated	$(ECY \times .83) / .46$	$(ECY \times .35) / .46$	$(ECY \times .25) / .6$	$(ECY \times .10) + 2.5$	\$206.90
Corn Non-Irrigated	$(ECY \times .83) / .46$	$(ECY \times .35) / .46$	$(ECY \times .25) / .6$	$(ECY \times .04) + 2.5$	\$206.90

Soybean Input Amounts (per Acre)	Urea (lbs./acre)	DAP (lbs./acre)	Potash (lbs./acre)	Diesel (gal/acre)	Costs not subject to price change
Soybean Irrigated	0	$(ECY \times .73) / .46$	$(ECY \times 1.1) / .6$	$(ECY \times .30) + 2.5$	\$111.50
Soybean Non-irrigated	0	$(ECY \times .73) / .46$	$(ECY \times 1.1) / .6$	$(ECY \times .10) + 2.5$	\$111.50

Expected cost estimation

MP Total Cost Calculation		
Costs not subject to price change	=	"Use Costs not subject to price change"
Costs subject to price change	=	(Input Price x Unit per acre)
Preliminary Total Costs	=	Total Costs + Variable Costs
Interest Rate Cost	=	Apply Interest Rate Calculation
		Costs not subject to price change + Costs subject to price change + Interest
MP Total Costs	=	cost

Nemaha County Example

144 bu/acre expected yield in 2022

	Projected Price	RP Price	Expected margin	Harvest Price	Final Margin
2022	\$5.06	\$5.90	\$384	?	?
2021	\$3.82	\$4.58	\$253	\$5.37	\$715
2020	\$4.03	\$3.88	\$259	\$3.99	\$461
2019	\$3.95	\$4.00	\$219	\$3.90	\$291
2018	\$3.97	\$3.96	\$244	\$3.68	-\$20.00

Nemaha 2022 example MP premiums

95% coverage: \$74/ acre

90% coverage: \$63/acre

85% coverage: \$47/acre

80% coverage: \$35/acre

75% coverage: \$29/acre

70% coverage: \$21/acre

Premium subsidy ranges from 44-59%

JUN 23	96.4350	96.4750	96.3800	96.3850

MP triggers - example

Expected Revenue = 150 bu * \$6 corn = \$900

Expected costs: \$300 subject to price changes, \$200 not subject to price changes (\$500 total, ignore interest costs for now for clarity)

Expected margin = \$900 – \$500 = \$400

95% MP (using as a high coverage policy)

Deductible = \$900 * (1-0.95) = 45

Trigger margin = (\$900-\$500) – 45 = \$355

MP Trigger: 20% input price increase

Input prices increase 20%, from \$300 to \$360. Everything else stays the same.

$$\text{Harvest margin} = \$900 - (\$200 + 360) = \$340$$

Trigger margin is \$355, you may receive an indemnity of **\$15** per acre

MP Trigger: 50% input price increase

Input prices increase 50%, from \$300 to \$450. Everything else stays the same.

$$\text{Harvest margin} = \$900 - (\$200 + 450) = \$250$$

Trigger margin is \$355, you may receive an indemnity of **\$105** per acre

MP Trigger: 20% yield decline

At harvest, only change is a 20% yield decrease: Yield is 120 bushels per acre. Harvest revenue is $120 \text{ bu} * \$6/\text{bu} = \720

Harvest margin = $\$720 - \$500 = \$220$

Trigger margin is \$355, which is greater than the harvest margin, so you may receive indemnity of approximately **\$135** per acre

MP Trigger: 20% corn price decrease

At harvest, only change is a 20% price decrease: Corn goes from \$6 /bu to \$4.80. Harvest revenue is $150 \text{ bu} * \$4.80 = \720

Harvest margin = $\$720 - \$500 = \$220$

Trigger margin is \$355, which is greater than the harvest margin, so you may receive indemnity of approximately **\$135** per acre

Interest costs example

Suppose harvest costs (excluding interest) are the same as expected, **\$500 per acre**.

Expected interest 9% (3% FF + 6%). Interest costs are **\$22.50 per acre** ($500 * 0.09 * (6/12)$)

Harvest interest doubles from current 3%FF to 6%FF, now for harvest margin interest is 12% (6%FF + 6%). Interest costs are **\$30 per acre** ($500 * 0.12 * (6/12)$)

Change from expected interest rate is less than \$8.00 per acre

Doubling of interest rate (FF) will only have a small impact on potential indemnities, but does cover changes in the cost of an operating loan

MP triggers & input costs – what matters?

- Takes a **historic** or **catastrophic** input cost increase to trigger a sizable indemnity
 - What else would happen if input costs go up this much?
- Protects against changes in the inputs for some raw material costs based on April/May futures, not exercise of market power
- In most years, payouts will be driven by price and yield declines
- Higher coverage policies
 1. Pay a lot
 2. Get paid a lot, but not necessarily often
 3. Long term perspective

Other details

- Harvest margin can be negative, liability (max payout) for an MP policy is similar to RP liability
- Premiums, expected margin won't be available until around Sept. 15 2022
- Premiums due at same time as RP, but payouts for 2023 crop year made in summer of 2024 (area product)
- Protection factor can scale up or down premium & indemnities

Current MP Estimate

Nemaha County

Non-irrigated corn

95% coverage level

100% protection factor

Preliminary

Based on \$5.94 / bu corn

Corn farms

Soybean farms

Historic trends

Kansas revenue and expense trends

Corn farm income

Soybean farm income

Margin – farm policy questions

- How to measure a margin: fixed or based on historic margins?
- How to measure farm costs in a timely fashion?
 - Actual unit costs or raw materials?
 - Survey based?
 - Index based?
- How would a margin payouts compare to price or revenue measures (ARC/PLC) over time?
 - Relationship with farm income / risk reduction
- Would a margin program be stable? More stable than ARC/PLC?

Concluding thoughts

- For producers who are comfortable with higher coverage policies
 - Expected margin is the highest it has been since 2018
 - Early price discovery (\$6.00 corn?)
 - Recent softening of input-futures benefits expected margin
 - Complement to ongoing cost-management
 - Exposure to diesel or fertilizer (component) price risk (April price discovery)
 - County yields
- Inflation is a major challenge for profitability
 - Low crop prices and yields will typically drive insurance losses
 - Farm policy: margins are a moving target, many questions remain

Moving forward

For producers: price discovery is in progress, but now is the time to reach out to an agent if you are at all interested in MP

Research: continued analysis of the relationship between crop prices, input prices and farm profit margins
